Background	A lack of MHC-II expression results in a severe	
	immunodeficiency syndrome called MHC-II	
	deficiency, or the bare lymphocyte syndrome (BLS;	
	MIM 209920). At least 4 complementation groups	
	have been identified in B-cell lines established from	
	patients with BLS. The molecular defects in	
	complementation groups B, C, and D all lead to a	
	deficiency in RFX, a nuclear protein complex that	
	binds to the X box of MHC-II promoters. The lack of

RFX binding activity in complementation group C results from mutations in the RFX5 gene encoding the 75-kD subunit of RFX (Steimle et al., 1995). RFX5 is the fifth member of the growing family of DNA-binding proteins sharing a novel and highly characteristic DNA-binding domain called the RFX motif. Multiple alternatively spliced transcript variants have been found but the full-length natures of only two have been determined. [provided by RefSeq, Jul 2008],

Western blot analysis of lysates from A431 cells, primary antibody was diluted at 1:1000, 4° over night

Immunohistochemical analysis of paraffin-embedded human liver cancer. 1, Antibody was diluted at 1:200(4° overnight). 2, Tris-EDTA,pH9.0 was used for antigen retrieval. 3,Secondary antibody was diluted at 1:200(room temperature, 45min).
