Background	Mammalian mitochondrial ribosomal proteins are
	encoded by nuclear genes and help in protein
	synthesis within the mitochondrion. Mitochondrial
	ribosomes (mitoribosomes) consist of a small 28S
	subunit and a large 39S subunit. They have an

estimated 75% protein to rRNA composition compared to prokaryotic ribosomes, where this ratio is reversed. Another difference between mammalian mitoribosomes and prokaryotic ribosomes is that the latter contain a 5S rRNA. Among different species, the proteins comprising the mitoribosome differ greatly in sequence, and sometimes in biochemical properties, which prevents easy recognition by sequence homology. This gene encodes a 39S subunit protein. [provided by RefSeq, Jul 2008],
