Background	Olfactory receptors interact with odorant molecules
	in the nose, to initiate a neuronal response that
	triggers the perception of a smell. The olfactory
	receptor proteins are members of a large family of
	G-protein-coupled receptors (GPCR) arising from

single coding-exon genes. Olfactory receptors share a 7-transmembrane domain structure with many neurotransmitter and hormone receptors and are responsible for the recognition and G protein-mediated transduction of odorant signals. The olfactory receptor gene family is the largest in the genome. The nomenclature assigned to the olfactory receptor genes and proteins for this organism is independent of other organisms.
